

Project Design Phase-I
Proposed Solution

Date	16 February 2026
Team ID	LTVIP2026TMIDS63806
Project Name	Heart Disease Analysis
Maximum Marks	2 Marks

Proposed Solution:

S.No.	Parameter	Description
1	Problem Statement (Problem to be Solved)	Healthcare professionals, hospital administrators, and public health researchers lack a centralized, data-driven platform to monitor heart disease risk factors, patient demographics, clinical indicators, and trend patterns. Patient data is often scattered across reports, spreadsheets, and electronic records, leading to delayed diagnosis, difficulty in identifying high-risk patients, and less effective preventive planning.
2	Idea / Solution Description	The Heart Disease Analysis Dashboard is an interactive Tableau/Power BI-based solution that integrates patient demographics, clinical metrics (cholesterol, blood pressure, heart rate), lifestyle factors, and risk classifications into a unified visualization platform. It enables demographic analysis, risk factor correlation, high-risk patient identification, and trend monitoring through interactive filters and drill-down features.
3	Novelty / Uniqueness	• Combines demographic segmentation, clinical indicators, and lifestyle risk analysis in one dashboard. Enables comparison across age groups, gender, and risk categories. • Uses story-based visualizations for clinical presentations and healthcare planning. Simplifies complex medical datasets into intuitive and easy-to-understand visual insights.
4	Social Impact / Customer Satisfaction	• Promotes early detection of high-risk heart disease patients. Supports preventive healthcare strategies and awareness programs. • Assists hospitals in improving patient outcomes and treatment efficiency. Enhances transparency and trust in data-driven clinical decision-making.
5	Business Model (Revenue Model)	• B2B subscription model for hospitals, diagnostic centers, and healthcare institutions. • Revenue from customized dashboard deployment and predictive risk analytics modules.Consulting services for healthcare analytics implementation and training.
6	Scalability of the Solution	Built on scalable BI and cloud-enabled infrastructure, the solution can integrate Electronic Health Records (EHR), wearable device data, and real-time patient monitoring systems. It can expand to support predictive risk modeling, hospital performance tracking, and large-scale public health analytics initiatives.
